

# SINGLE FLUSH BUTTON Installation Instruction

*(To be carried out with outlet valve fitted in cistern)*

1. **Fit the push button assembly (1)** into the cistern lid and secure with the backnut (2), aligning the slot between the push buttons at 90° to the front of the cistern (Figure A).

2. **Push ratchet bars** through push button slots with spigot ends facing downwards and outwards so that the bars project sufficiently through the cover bush bosses to enable the plunger to be fitted.
3. **Push the button plunger** onto the ratchet bars (Figure B).
4. **Fit cistern lid onto cistern** ensuring that it is positioned correctly.

5. **Whilst holding the 2 buttons** firmly down, push top end of both ratchet bars simultaneously, press down the ratchet bars with thin bladed screwdrivers until they stop, then release.
6. **If the top ends of the ratchet bars** are level or below the push button face, push the cover cap into position Figure C, ensuring pips on underside of cover line up with slots between buttons.

7. **If the ratchet bar ends** protrude above the push button face, make a mark on the ratchet bars, level with the button face.
8. **Remove the cistern lid** and pull the ratchet bars out of the buttons from underneath and remove plunger.
9. **Cut the ratchet bars** on the first notch below the mark.
10. **Repeat steps 2 through to 6.**
